“we’re going to need a lot more compute where we’re going”

Andrej Karpathy
@karpathy

haha actually - huge successover the weekend, i just wanted to write it up a bit but didn't get enough time to finish that. many people's reaction was why would you need so much compute(mac mini) but i found it's not enough compute, even after addin my DGX spark to the home.compute fabric. we're going to need a lot more compute where we're going

NVIDIA OpenShell

Safely Build Autonomous, Self-Evolving Agents

Sandbox

Isolated execution environment
for long running agents

Policy Engine

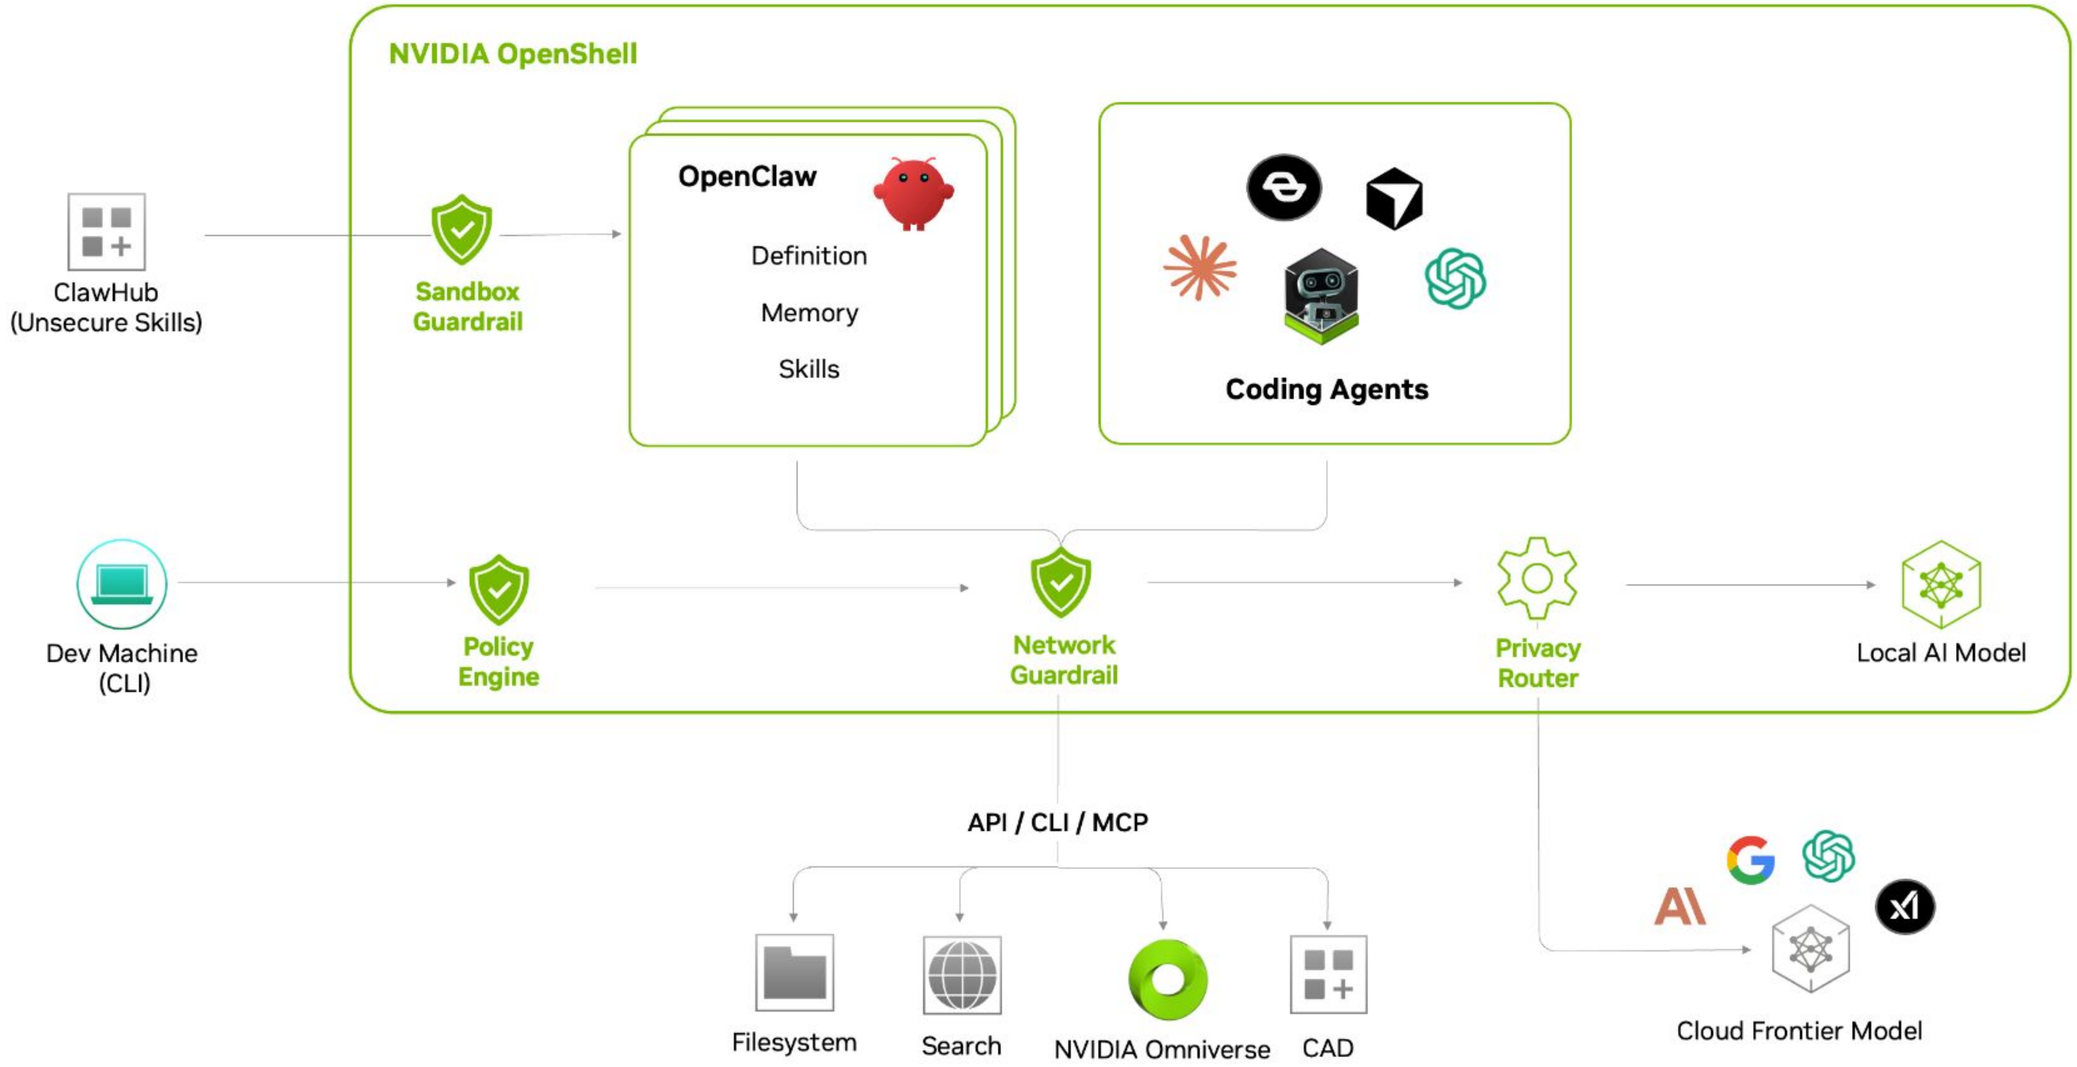
Granular oversight on installing
packages and spawning sub-agents

Privacy Router

Local inference for private tasks
and network access for others

NVIDIA OpenShell - The Safer Runtime for Agents

Safely Build and Run Autonomous, Self Evolving Agents



Anywhere Developers Are

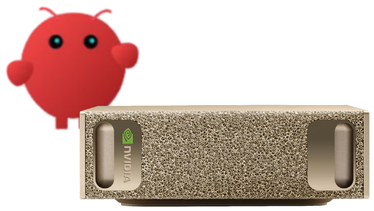
Workstation

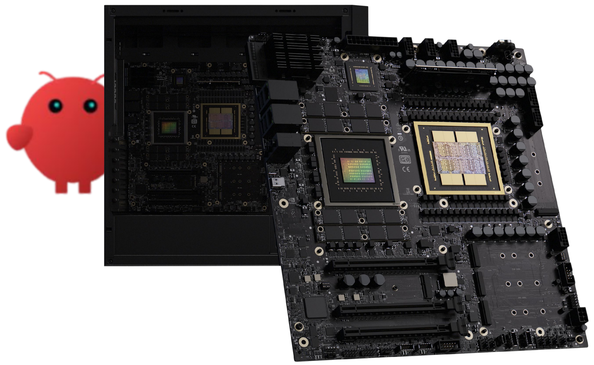
NVIDIA DGX Spark and DGX Station to Build Safer Autonomous, Self-Evolving Agents

DGX Spark



- Desktop AI Computer for Everyone
- 200B Parameter Models
- Power efficient for always on agents

DGX Station



- World's Fastest Desktop AI Supercomputer
- 1T Parameter Intelligence
- Grace Blackwell Ultra performance

OpenShell

Isolated Sandbox and Governance for Safe, Productive Claws

docs.nvidia.com/openshell

Alpha software — single-player mode. OpenShell is proof-of-life: one developer, one environment, one gateway. We are building toward multi-tenant enterprise deployments, but the starting point is getting your own environment up and running. Expect rough edges. Bring your agent.
